

# Week 4: Termination

## Local Consistency revisited

# Idea

- Make sure that each loop is executed only finitely often ...
- For each loop, identify an indicator value  $r$ , that has two properties
  - (1)  $r > 0$  whenever the loop is entered;
  - (2)  $r$  is decreased during every iteration of the loop.
- Transform the program in a way that, alongside ordinary program execution, the indicator value  $r$  is computed.
- Verify that properties (1) and (2) hold!

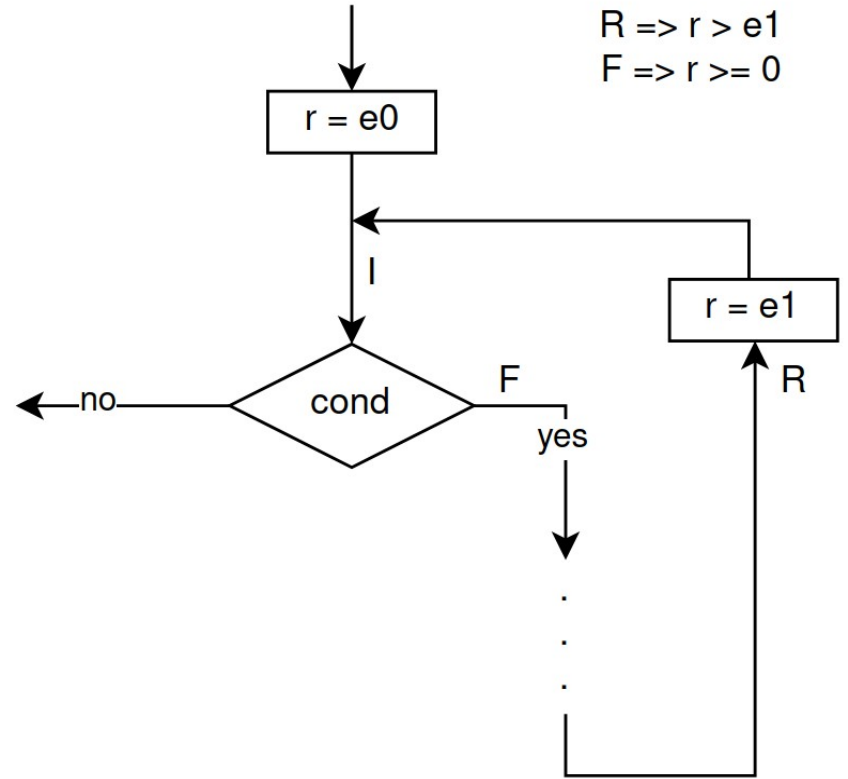

## General Method

- For every occurring loop `while (b) s` we introduce a fresh variable `r`.
- Then we transform the loop into:

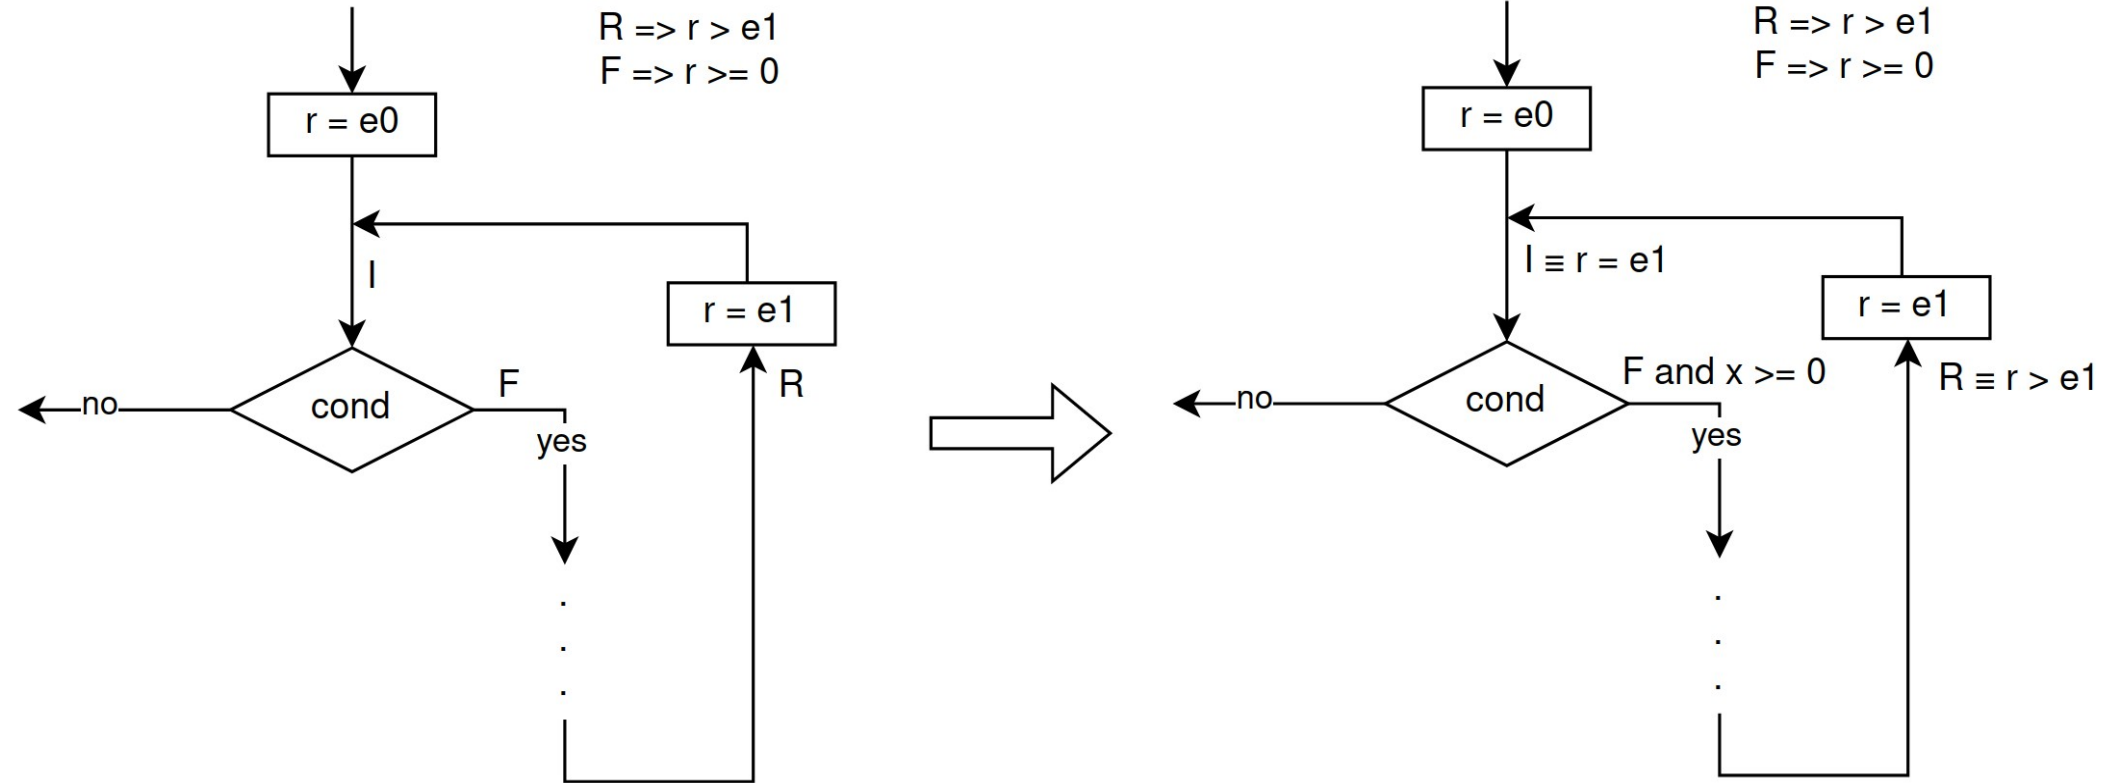

```
1  r = e0;  
2  while(b) {  
3      assert(r > 0);  
4      s;  
5      assert(r > e1);  
6      r = e1;  
7  }
```

for suitable expressions `e0, e1`.
